REDENSITY [I]: A TREATMENT TO LIGHT UP THE SKIN

"It is not only because of ageing that the first lines appear on our face and that the skin loses its brightness. It's also due to our lifestyle. An excessive exposure to sunlight and tanning lamps, the stress generated by our current daily life, an incorrect diet, and of course smoking these are the main factors that adversely affect skin quality and youthfulness.

MY PERSONAL
PROTOCOL

synthesis and the alpha-lipoic acid
which is necessary to increase

*Thanks to this product,
I can offer my patients the
"bonne mine" look which
they really are looking
and asking for.*

Spinal Italy

My technique consists in micro-injections with a 30 1/2 G needle. I usually inject in the superficial layer just inserting the tip of the needle. At the end of the treatment, I proceed with a gentle but sustained massage to distribute TEOSYAL® PURESENSE REDENSITY [1] in all the compartments of the face. This allows me to uniformly spread the product under the skin.

When I see patients with "dull skin", I usually suggest some sessions of redensification: thanks to this procedure I am able to create a regeneration, a detoxification and a protection of the dermal cells. I always obtain very positive results with an innovative product which enables skin redensification and restoration of its brightness: TEOSYAL® PURESENSE REDENSITY [1].

This product has an exclusive formula with selected non-allergenic ingredients:

- A non-cross-linked Hyaluronic Acid (HA) at 15 mg/ml, which is the ideal concentration to give hydration and redensify the dermis.
- A patented complex that plays an important role in the treatment thanks to its active ingredients: 8 amino acids, including in particular glycine which has the peculiarity to fit inside the dermis especially in spaces in which other amino acids can't get and leucine which is essential for the process of regeneration. The formula also contains 3 powerful antioxidants among which the well-known glutathione which acts against both free radicals and negative molecules in dermal cells, the N-acetyl-L-cysteine which is essential for glutathione

complex also includes 2 minerals, zinc and copper, both necessary for the well-being and protection of the dermal cells. Lastly, the formula also contains vitamin B6, crucial for the metabolism of the cells and thus the brightness of the skin.

- Lidocaine which offers a better comfort to patients during injection.

All these substances work together on the synthesis of new collagen fibers and contribute to the remodeling of cutaneous tissue.

My areas of treatment are mainly the face, neck and necklines.

To obtain the expected results, my protocol consists in 4 close sessions, one every 3 weeks. I repeat the protocol twice a year to maintain over time the positive improvements that this treatment offers for my patients.*
